1. Executive Summary

2. The Problem: Why Most SMEs Operate on Intuition, Not Intelligence

Across Nigeria, broader Africa, and the United States, the majority of SMEs share a common operating pattern: decisions are made based on founder intuition, anecdotal customer feedback, and fragmented information.

Three structural barriers prevent most SMEs from becoming data-driven:

- **The Capability Gap.** Access to AI tools has exploded. The ability to use them effectively has not. A founder with access to ChatGPT still lacks the frameworks to translate a prompt into a pricing strategy, a retention plan, or a market entry analysis. The U.S. Chamber of Commerce found that 58% of small businesses now use generative AI, more than double the rate in 2023. But usage does not equal capability. Among the smallest firms (under five employees), 82% say AI simply is not applicable to their business, a belief that drops sharply as business size increases, suggesting the barrier is education, not relevance.

Sources: U.S. Chamber of Commerce, Empowering Small Business Report, 2025; SBA Office of Advocacy, AI in Business, September 2025.

- **The Cost Barrier.** Traditional management consulting firms charge fees that exceed the annual revenue of many SMEs. A strategy engagement with a top-tier firm can run into tens of thousands of dollars. For a business generating under ₦100 million annually, a common range among growth-stage Nigerian SMEs, this is not a consideration; it is an impossibility. According to SMEDAN and NBS data, 64.5% of micro-enterprises in Nigeria have monthly turnovers below ₦50,000, while many small and medium enterprises operate in the low millions of Naira annually.

Sources: SMEDAN/NBS MSME Survey Report, 2021; Moniepoint Small Business Statistics, 2026.

- **The Relevance Problem.** Most analytics platforms are designed for enterprise environments with mature data infrastructure, dedicated IT teams, and standardized processes. Small businesses now manage an average of 25 to 55 SaaS applications, yet tool fatigue persists: many owners underutilize available analytics, and fewer than half of small businesses report effectively using data to inform strategic decisions. An SME owner in Lagos or Atlanta does not need a Tableau license. They need someone to tell them whether their business idea is viable, when cash flow becomes negative, and which marketing channel will deliver the highest return on a limited budget.

Sources: BetterCloud SaaS Usage Report; Marketing LTB SaaS Statistics, 2025.

The result is a market where the businesses that need intelligence the most are least likely to have it. BeamX is bridging that gap.

3. The Market Opportunity

3.1 The African SME Landscape

Africa is home to one of the largest and fastest-growing SME ecosystems in the world. In Nigeria alone, SMEs account for approximately 48% of GDP and represent over 39.6 million MSMEs, constituting roughly 96% of all businesses in the country. These enterprises employ approximately 80% of the national workforce, underscoring their instrumental role in economic growth and job creation.

Sources: SMEDAN/NBS MSME Survey, 2021; Agusto Research 2025 Nigerian SME Industry Report; PwC MSME Survey 2024.

Yet the vast majority of these businesses operate without structured data infrastructure, standardized financial reporting, or access to decision-support tools. Over 95% of Nigerian SMEs fail within their first five years, often due to factors that structured intelligence could help mitigate: lack of market demand (affecting over 40% of failures), inadequate financing, and poor operational visibility.

Sources: SMEDAN Nigerian MSME Report, 2022; Moniepoint Small Business Statistics, 2026.

The convergence of three forces is creating a generational opportunity: rising mobile and internet penetration, a growing class of digitally aware young entrepreneurs, and an expanding fintech ecosystem that is normalizing digital transactions. These forces are generating unprecedented volumes of business data. What is missing is the intelligence layer that transforms that data into strategy.

3.2 The US SME Market

In the United States, small businesses represent 99.9% of all firms, totaling 36.2 million businesses that account for nearly 46% of private-sector employment. From March 2023 to March 2024, small businesses created approximately nine out of every ten net new jobs in the economy.

Source: SBA Office of Advocacy, 2025 Small Business Profile.

While US SMEs have greater access to technology, the challenge is different but equally acute: tool fatigue. Small businesses now manage an average of 25 to 55 SaaS applications, yet fewer than half report effectively using data analytics to inform strategic decisions. Nearly 99% of small businesses use at least one technology platform, but using tools and extracting strategic value from them are fundamentally different capabilities.

Sources: BetterCloud; U.S. Chamber of Commerce Empowering Small Business Report, 2025.

BeamX targets a specific underserved segment within both markets: growth-stage businesses generating between ₦50M and ₦500M in Nigeria (or $500K to $5M in the US) that have outgrown gut-driven decision-making but have not yet reached the scale where enterprise analytics platforms make economic sense.

3.3 The Addressable Market

The global business intelligence market was valued at approximately $34-39 billion in 2024-2025, with projections reaching $56-86 billion by 2030, growing at a CAGR of 8-14% depending on the scope of measurement. The SME segment is consistently identified as the fastest-growing category within this market, driven by the availability of affordable cloud-based analytics tools and pay-as-you-go pricing models.

Sources: Mordor Intelligence, 2025; Grand View Research, 2025; Fortune Business Insights, 2025; Research and Markets, 2025.

Within Africa, the data analytics and business intelligence market remains in an early growth phase but is accelerating rapidly. The Middle East and Africa retail analytics market alone was valued at $1.26 billion in 2025 and is projected to reach $2.79 billion by 2033, with the SME segment growing fastest. South Africa's data analytics market is expected to reach approximately $2.76 billion by 2030 at a 17.3% CAGR. Nigeria, Kenya, and Egypt are emerging as key markets driven by rising mobile broadband usage and government-led digital transformation initiatives.

Sources: Data Bridge Market Research, 2025; Grand View Research, 2025; Market Data Forecast, 2025.

BeamX's serviceable addressable market (SAM) sits at the intersection of two trends: the expanding global SME BI market and the underserved African SME intelligence segment. With over 39 million MSMEs in Nigeria alone and 36.2 million small businesses in the US, even capturing a fraction of one percent of growth-stage businesses in both markets represents a significant revenue opportunity.

4. BeamX's Approach: Strategy-First Intelligence

BeamX operates on a foundational principle: business goals dictate the technology, not the other way around. This "strategy-first" philosophy distinguishes BeamX from both traditional consulting firms and generic AI tool providers.

The approach is built on three pillars:

- **Guided Intelligence over Raw Access.** Rather than handing users a blank prompt or a complex dashboard, BeamX products guide users through structured workflows that translate their specific business context into tailored outputs. Every interaction begins with the business question, not the technology.
- **Frameworks with Firepower.** BeamX products are powered by proven strategic frameworks drawn from established business thinking (Collins, Dib, Porter, Hormozi, Ries) and augmented with machine learning models trained on real market patterns. This is the "Legends + Logic" philosophy in action: timeless strategy principles, delivered through cutting-edge AI.
- **Accessibility without Compromise.** Enterprise-grade analysis does not require enterprise-grade budgets. BeamX products are priced and designed for the owner-operator who manages their

business from a phone, not a corner office. The interface is conversational, the outputs are actionable, and the pricing reflects the realities of African-market economics.

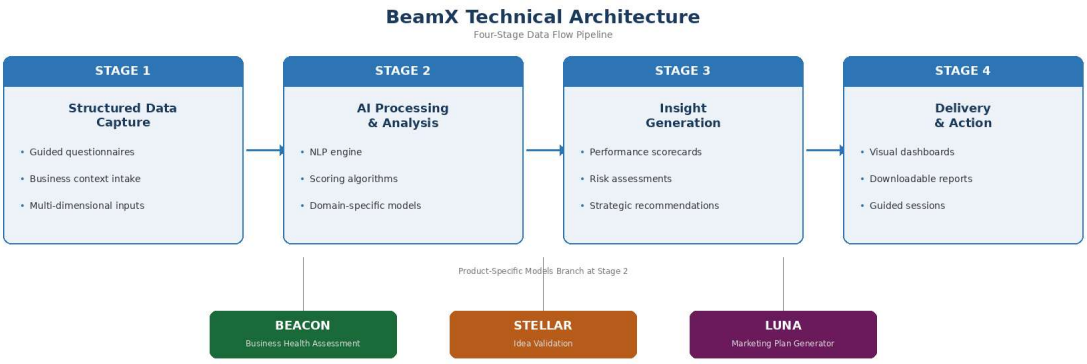
5. Technical Architecture Overview

BeamX's product suite is powered by a unified technical architecture designed for scalability, security, and speed. While each product serves a distinct use case, all three share a common data pipeline that moves from user input to AI analysis to actionable output.

5.1 The Data Flow Pipeline

The BeamX architecture follows a four-stage pipeline:

- **Stage 1: Structured Data Capture.** Users interact with guided questionnaires and input workflows tailored to each product. These workflows are designed to extract the right information in the right sequence, minimizing friction while maximizing diagnostic accuracy. Beacon uses a multi-dimensional assessment framework. Stellar uses a structured idea intake covering market, model, and feasibility dimensions. Luna uses a business-context intake that captures goals, audience, budget, and competitive landscape.
- **Stage 2: AI Processing and Analysis.** User inputs are processed through BeamX's AI engine, which is powered by large language models (LLMs) combined with domain-specific scoring algorithms. Beacon leverages OpenAI's GPT models to run its weighted scorecard engine across five dimensions, generating nuanced diagnostic insights. Stellar and Luna are powered by Anthropic's Claude, which handles idea validation analysis and marketing plan generation respectively. Each product applies proprietary prompt architectures and analytical frameworks layered on top of the foundational LLM capabilities, ensuring outputs are not generic AI responses but structured, strategy-grade deliverables.
- **Stage 3: Insight Generation.** Raw analysis is transformed into structured, human-readable outputs. These include performance scorecards, risk assessments, strategic recommendations, tactical plans, and benchmark comparisons. Every output is designed to be immediately actionable without requiring interpretation by a data analyst.
- **Stage 4: Delivery and Action.** Outputs are delivered through the BeamX platform in formats optimized for decision-making: visual dashboards, downloadable reports, and step-by-step implementation plans. Luna also offers a premium guided session where a strategist walks the business owner through their plan.



5.2 Technology Stack

BeamX's infrastructure is built on a modern, cloud-native stack designed for reliability and rapid iteration:

- **Frontend:** Responsive web application optimized for mobile-first usage patterns common in African markets
- **AI Layer:** Large language model (LLM) integration via OpenAI GPT (Beacon) and Anthropic Claude (Stellar, Luna), with proprietary prompt engineering, domain-specific frameworks, and structured output pipelines
- **Backend:** Scalable API architecture handling concurrent user sessions and real-time processing
- **Data Layer:** Secure storage with encryption at rest and in transit, compliant with applicable data protection regulations
- **Analytics:** Internal performance monitoring and product usage analytics for continuous improvement

5.3 AI Pipeline Architecture

BeamX's AI pipeline goes beyond single-shot prompting. Each product employs a multi-layered architecture designed to maximize output quality and relevance:

- **Structured Prompt Chains.** Rather than submitting a single prompt to an LLM, BeamX decomposes each product workflow into sequential prompt stages. For example, a Luna marketing plan is not generated in one pass. The system first processes the business context to identify the target customer profile, then analyzes competitive positioning, then generates channel strategies, and finally assembles the tactical plan. Each stage builds on the verified output of the previous one, reducing the compounding of errors that plagues single-shot AI generation.
- **Fine-Tuned Models.** Beacon operates on a fine-tuned version of OpenAI's GPT models, trained via OpenAI's fine-tuning API on BeamX's proprietary assessment data. This fine-tuning process calibrates the model to produce more accurate diagnostic outputs, sector-appropriate language,

and scoring patterns that align with BeamX's five-dimension framework. The result is a model that behaves less like a general-purpose assistant and more like a specialized business diagnostician. Stellar and Luna use base LLM capabilities (Anthropic's Claude) augmented through prompt engineering and RAG, with fine-tuning planned as the user base and training data mature.

- **Retrieval-Augmented Generation (RAG).** BeamX products augment LLM reasoning with contextual retrieval from curated knowledge bases. When Beacon generates sector-specific recommendations, it retrieves relevant benchmarks and strategic frameworks from BeamX's proprietary reference library before generating the output. This ensures recommendations are grounded in established business intelligence rather than relying solely on the LLM's training data. Similarly, Stellar retrieves market-context data to validate competitive and feasibility assessments.
- **Structured Output Parsing.** All product outputs pass through structured validation layers that enforce formatting, logical consistency, and completeness before delivery. Scorecard dimensions must sum correctly. Marketing plans must include all required components (channels, timelines, budgets, KPIs). Validation reports must address each assessment dimension. This prevents incomplete or malformed outputs from reaching the user.

6. Product Deep Dives

6.1 Beacon: Business Health Assessment

Beacon is an AI-powered diagnostic engine that evaluates businesses across five critical dimensions: Financial Health, Customer Strength, Operational Maturity, Financial Intelligence, and Growth & Resilience. The output is a quantified performance scorecard with sector-specific benchmarking and prioritized strategic recommendations.

How It Works

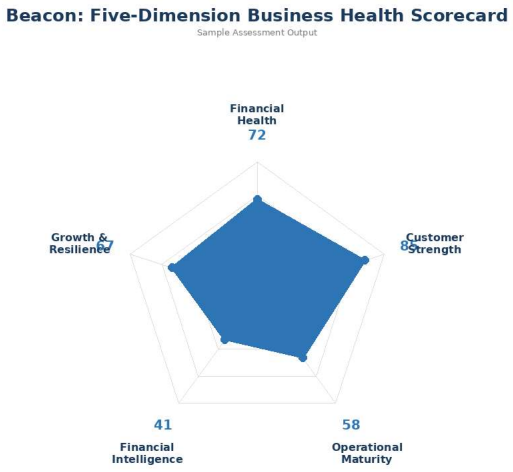
Business owners complete a structured assessment (approximately 20 questions) that captures key indicators across all five dimensions. Beacon's scoring engine processes these inputs against industry benchmarks and returns a comprehensive health report with a numerical score, dimension-level breakdowns, and a ranked list of strategic recommendations ordered by impact and feasibility.

Target User

Established business owners (1+ years of operation) who feel stuck, want to know where to focus, or are preparing for investment, expansion, or strategic pivots. Also valuable for business advisors and consultants who want a structured diagnostic tool for their own clients.

Key Differentiators

- Designed specifically for SMEs in African markets, not adapted from enterprise frameworks
- Produces prioritized, actionable recommendations rather than generic dashboards
- Benchmark comparisons calibrated to relevant sectors and geographies
- Accessible interface that requires no technical or financial expertise to navigate



6.2 Stellar: Business Idea Validator

Stellar is a pre-launch intelligence system that stress-tests business concepts before entrepreneurs invest significant time and capital. It analyzes market viability, competitive positioning, revenue potential, and operational feasibility, then delivers a clear go/no-go assessment with specific recommendations for strengthening the concept.

How It Works

Aspiring entrepreneurs input their business idea through a guided workflow that captures the concept, target market, proposed business model, competitive landscape, and resource constraints. Stellar's analysis engine evaluates the idea across multiple viability dimensions, identifies potential fatal flaws, validates or challenges key assumptions, and suggests pivots or refinements. The output is a structured validation report with a viability score and prioritized action items.

Target User

First-time and repeat entrepreneurs at the idea or pre-revenue stage who want to de-risk their next venture. Also valuable for accelerators, incubators, and angel investors who need a standardized framework for evaluating deal flow.

Key Differentiators

- Moves beyond surface-level idea validation to stress-test financial feasibility and competitive dynamics

- Provides specific, actionable refinements rather than a simple pass/fail
- Accessible to non-technical founders; no business plan or financial model required as input
- Reduces the cost of idea validation from thousands of dollars (traditional consultants) to a fraction of the price

6.3 Luna: Marketing Plan Generator

Luna is an AI marketing strategist that creates customized, execution-ready marketing plans tailored to a business's model, budget, and growth objectives. Unlike template-based tools, Luna analyzes competitive landscape, target customer psychographics, and channel effectiveness to design integrated campaigns with measurable outcomes.

How It Works

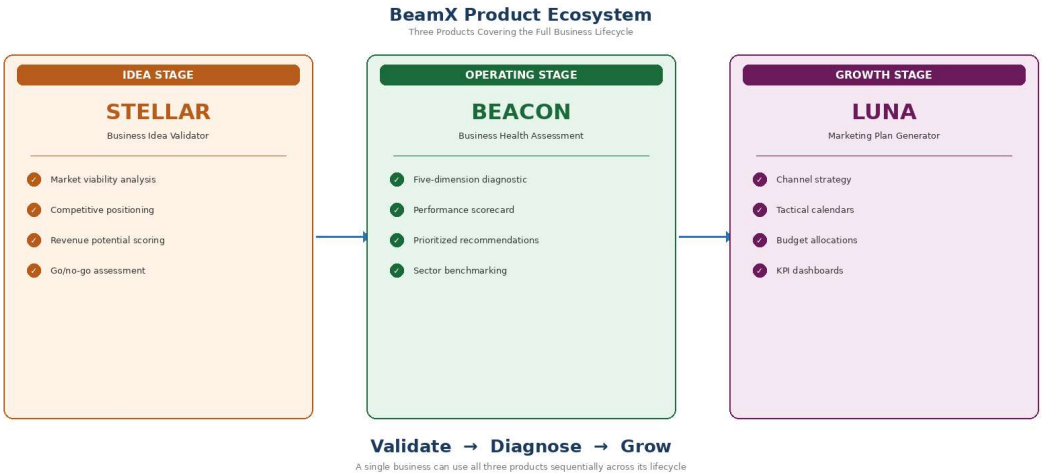
Business owners complete a guided intake that captures their business model, target audience, current marketing efforts, budget, and growth goals. Luna's engine processes this context against marketing effectiveness data and channel performance benchmarks to produce a comprehensive marketing plan. The plan includes customer persona definitions, channel strategies, messaging frameworks, tactical calendars, budget allocations, and KPI dashboards. Luna is also available as a premium guided Marketing Blueprint Session, where a BeamX strategist walks the business owner through the plan and helps prioritize implementation.

Target User

Business owners generating revenue but struggling to grow systematically. Also valuable for marketing managers at SMEs who need a strategic framework to align their tactical efforts, and for agencies seeking a structured planning tool for client engagements.

Key Differentiators

- Produces execution-ready plans with specific tactics, timelines, and budgets, not abstract strategy documents
- Analyzes competitive landscape and customer psychographics rather than relying on generic templates
- Premium guided session option bridges the gap between self-service AI and traditional consulting
- Plans are calibrated for African-market realities: budget constraints, channel availability, and local consumer behavior



7. Composite Case Study

Note: The following scenario is a composite case study that blends patterns observed across real BeamX user engagements. It does not represent a single client, and specific figures are illustrative. The business name and details are fictional, but the challenges and product interactions reflect recurring themes from over 500 businesses assessed through the BeamX platform.

Meet "FreshMart": A Mid-Size Nigerian Retail Business

FreshMart is a hypothetical chain of three grocery stores in Lagos, generating approximately ₦120M in annual revenue. The founder, Adaeze, has grown the business over four years through personal relationships and local reputation. She knows the business is underperforming but cannot pinpoint where the problems lie. She is also considering opening a fourth location and wants to expand her customer acquisition beyond word-of-mouth.

Phase 1: Beacon Assessment

Adaeze begins with a Beacon assessment. The diagnostic reveals that while FreshMart's Customer Strength score is high (loyal repeat customers), its Financial Intelligence score is critically low: margins are being eroded by inconsistent supplier pricing, and there is no system for tracking inventory shrinkage. Operational Maturity scores mid-range, with manual processes creating bottlenecks during peak hours. Beacon's prioritized recommendations direct Adaeze to address supplier contract standardization and inventory tracking before pursuing expansion.

Phase 2: Stellar Validation

Before committing capital to a fourth location, Adaeze runs the concept through Stellar. The validation reveals that the proposed neighborhood has high foot traffic but also three established competitors within a 2km radius, depressing the revenue potential below her break-even threshold. Stellar suggests an alternative: rather than a full fourth store, a smaller-format "express" location near a transit hub,

with a delivery component. This pivot reduces upfront investment by an estimated 40% while accessing an underserved customer segment.

Phase 3: Luna Marketing Plan

With the revised expansion concept validated, Adaeze uses Luna to build a marketing plan for the new location. Luna identifies that FreshMart's most profitable customer segment (young professionals aged 28 to 40) indexes heavily on Instagram and WhatsApp, and recommends a pre-launch campaign combining location-based Instagram ads, a WhatsApp broadcast list for early access offers, and a referral incentive tied to her existing loyalty customers. The plan includes a 90-day tactical calendar, a budget allocation of ₦2.5M across three channels, and KPIs for tracking customer acquisition cost and first-month revenue.

Hypothetical Outcome

In this scenario, the integrated use of all three BeamX products would allow Adaeze to diagnose her existing business health, avoid a potentially costly expansion mistake, pivot to a more viable growth strategy, and execute a targeted marketing plan, all within weeks rather than months and at a fraction of the cost of a traditional consulting engagement.

8. Security, Privacy & Compliance

BeamX handles sensitive business data and takes its responsibility as a data custodian seriously. The following principles govern data handling across all products:

- **Data Encryption.** All data is encrypted at rest and in transit using industry-standard protocols (AES-256 for storage, TLS 1.2+ for transmission).
- **Data Minimization.** BeamX collects only the information necessary to deliver product outputs. No personally identifiable information (PII) is required beyond basic account creation details.
- **Access Controls.** Role-based access controls ensure that user data is accessible only to authorized systems and personnel. No third-party access is granted without explicit user consent.
- **Compliance.** BeamX is designed with compliance in mind for the Nigeria Data Protection Regulation (NDPR) and applicable US data protection standards. As the company scales, SOC 2 Type II certification and GDPR compliance are on the roadmap.
- **AI Data Usage.** User inputs processed through AI models are not used to train third-party models. BeamX maintains clear boundaries between user data and model improvement pipelines.

8.1 AI Limitations and Quality Controls

BeamX builds on large language models, and responsible deployment requires acknowledging the known limitations of this technology. The following risks are actively managed across the product suite:

- **Output Quality and Hallucination Risk.** LLMs can generate plausible but inaccurate content. BeamX mitigates this through structured prompt chains that constrain the model's output space, retrieval-augmented generation that grounds responses in verified reference data, and structured output validation that checks for logical consistency. Luna's premium guided session adds a human review layer where a BeamX strategist validates the plan before the business owner acts on it.
- **Input Dependency.** All AI-generated outputs are fundamentally shaped by the quality of user inputs. BeamX's guided intake workflows are designed to minimize ambiguity and surface critical context, but users who provide incomplete or inaccurate information will receive correspondingly less precise outputs. Each product includes prompts and clarifying questions to improve input quality, and Beacon's assessment framework is deliberately structured to reduce subjectivity in self-reported data.
- **Benchmark Limitations in African Markets.** Reliable business performance benchmarks for African SMEs remain scarce compared to developed markets. BeamX addresses this by supplementing published data with patterns derived from its own user base, but acknowledges that benchmarks for certain sectors and geographies may be less robust in the early stages. As the user base scales, benchmark precision will improve proportionally.
- **Compliance Status.** BeamX is currently designed with Nigeria Data Protection Regulation (NDPR) and applicable US data protection standards in mind. SOC 2 Type II certification and GDPR compliance are on the product roadmap as the company scales, but are not yet achieved. BeamX is transparent about this timeline and prioritizes data security practices that align with these standards in advance of formal certification.

9. Competitive Differentiation

BeamX operates at the intersection of three categories: management consulting, business SaaS tools, and AI-powered analytics platforms. Its differentiation lies in combining the strategic depth of consulting with the scalability of software and the intelligence of AI, all at a price point accessible to growth-stage SMEs.

Capability	BeamX	Consulting Firms	Generic AI Tools	SaaS Dashboards
Strategy-first analysis	Yes	Yes	No	Limited
SME-affordable pricing	Yes	No	Yes	Varies
Guided user experience	Yes	Yes	No	No
Scalable (no human bottleneck)	Yes	No	Yes	Yes
Local market context	Yes	Rarely	No	No
Actionable output (not raw data)	Yes	Yes	Limited	Limited

The critical insight is this: consulting firms deliver strategy but do not scale. SaaS tools scale but lack strategic depth. Generic AI tools are powerful but require the user to know what to ask and how to apply the answer. BeamX is the first platform to combine all three qualities in a single, accessible product suite.

10. The Road Ahead: 2025-2027 Vision

BeamX's growth strategy follows a deliberate four-phase roadmap:

Phase 1: Foundation (2024-2025) — Complete

Built the core product suite (Beacon, Stellar, Luna). Validated product-market fit through direct user engagement. Established the technical architecture and operational infrastructure. Launched in Nigeria.

Phase 2: Validation (2025-2026)

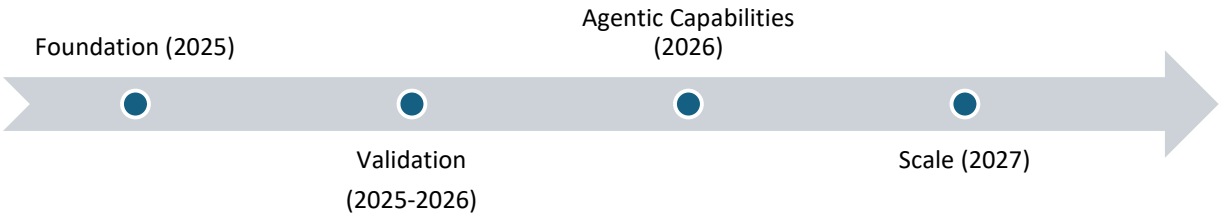
Deepen user acquisition and retention metrics. Refine product outputs based on user feedback loops. Establish revenue benchmarks and unit economics. Build strategic partnerships with accelerators, universities, and ecosystem players.

Phase 3: Consolidation & Agents (2026)

Consolidate the product suite under a unified platform experience. Introduce AI agents that enable users to take direct action on product outcomes, moving BeamX from insight delivery to execution support. For example, a Beacon assessment that identifies a retention gap could trigger an agent to draft a customer re-engagement workflow, or a Luna marketing plan could auto-generate ad copy and scheduling recommendations. Expand product distribution through B2B partnerships with banks, accelerators, and business development organizations. Deepen market presence across West Africa and the US.

Phase 4: Scale (2027)

Establish BeamX as the default intelligence layer for SMEs in Africa. Scale the agent-powered platform to handle end-to-end business workflows, from diagnosis through execution. Introduce API-level integrations with fintech platforms, lending institutions, and business management tools. Pursue strategic investment and/or institutional partnerships to accelerate continental expansion.



11. What Comes Next

For Business Leaders

If you are running a growth-stage business and making critical decisions without structured intelligence, the impact of your decisions compounds daily. BeamX's products are designed to provide you with data-backed directions. Start with a free Beacon assessment to see exactly where your business stands today and receive your first strategic roadmap.

Beacon: www.beamxsolutions.com/products/beacon

Connect with us: www.calendly.com/beamxsolutions/connect

For Investors and Partners

BeamX is building the intelligence infrastructure for the next generation of African and global-market businesses. If you are an investor, accelerator, or institutional partner interested in the SME intelligence space, we welcome the conversation.

Appendix: Glossary of Key Terms

Term	Definition
AI (Artificial Intelligence)	Technology that enables systems to perform tasks that typically require human intelligence, such as analyzing data, recognizing patterns, and generating recommendations.
AI Agent	An autonomous AI system that can take actions on behalf of a user, such as generating content, executing workflows, or triggering processes based on analytical outputs. BeamX's roadmap includes agents that help users act on product recommendations.
API (Application Programming Interface)	A set of protocols that allows different software systems to communicate with each other. Enables BeamX products to integrate with external platforms.
Business Health Scorecard	A quantified performance report generated by Beacon that evaluates a business across five dimensions and provides prioritized recommendations.
Channel Effectiveness	A measure of how well a specific marketing channel (e.g., Instagram, email, WhatsApp) performs in reaching and converting target customers.
Customer Psychographics	A method of classifying customers based on their values, attitudes, interests, and behaviors rather than demographics alone.
Data Infrastructure	The foundational systems (databases, APIs, storage) that collect, organize, and make data accessible for analysis.
Fine-Tuning	The process of further training a pre-trained AI model on a specialized dataset to improve its performance on specific tasks. BeamX fine-tuned OpenAI's GPT model for Beacon using proprietary business assessment data.
KPI (Key Performance Indicator)	A measurable value that indicates how effectively a business is achieving its objectives.
LLM (Large Language Model)	A type of AI model trained on vast amounts of text data that can understand and generate human language. BeamX uses OpenAI's GPT models for Beacon and Anthropic's Claude for Stellar and Luna.
MSME	Micro, Small, and Medium Enterprise. The standard classification used in Nigeria and other African markets.
NLP (Natural Language Processing)	A branch of AI that enables computers to understand, interpret, and generate human language.
Prompt Chain	A technique where multiple sequential AI prompts are used in series, with each stage building on the output of the previous one, to produce more accurate and structured results than a single prompt.
RAG (Retrieval-Augmented Generation)	An AI architecture that combines large language model generation with information retrieval from curated knowledge bases, grounding AI outputs in verified reference data rather than relying solely on the model's training.

Scoring Algorithm	A mathematical model that assigns numerical scores to inputs based on predefined criteria and weights.
SME (Small and Medium Enterprise)	Businesses that fall below certain thresholds for revenue, employee count, or assets. Definitions vary by country and context.
Unit Economics	The revenue and costs associated with a single unit of a product or service, used to evaluate business model viability.
